Unit Test Report

Task Manager Application | Team 4 | Test execution: 6 November 2026

1. Test execution summary

Measure	Actual result
API integration checks executed	18
Passed	18
Failed	0
Pass rate	100%

2. Evidence collected

Frontend checks: **npm run lint** completed with no ESLint errors; **npm run build** completed successfully (Vite 8.3.4).

Backend: **npm ci** completed; **npm run dev** started the API at http://localhost:5000.

Database health endpoint returned **status=OK** and **database=task_manager**.

Automated live API integration test run: **18 total, 18 passed, 0 failed**. The test script reported cleanup of its two QA users and their tasks.

Coverage was collected with c8 while the backend server was instrumented and the API tests were run against it. These are backend coverage results only.

3. Unit testing status

An isolated unit-test suite was not run in this execution. The 18 passing checks are live API integration tests exercising the running Express application and PostgreSQL database. They must not be represented as 18 isolated unit tests.

Areas exercised include authentication validation, registration, login, task input validation, task creation/listing/status updates, and cross-user access restrictions.

4. Remaining unit-test work

Add isolated tests for individual route handlers, authentication middleware, validation branches, and dashboard calculations. Execute them separately and retain their test-runner output.
