Branch Coverage Report

Task Manager Application | Team 4 | Test execution: 6 November 2026

1. Actual branch coverage

Scope / file	Branch coverage
All instrumented backend files	85.71%
backend directory	75%
backend/db.js	100%
backend/server.js	66.66%
backend/middleware/auth.js	100%
backend/routes/auth.js	100%
backend/routes/tasks.js	100%

2. Interpretation

The overall c8 report printed 85.71% branch coverage. Individual reported branch coverage was 66.66% for server.js, and 100% for db.js, auth middleware, auth routes, and task routes.

High branch coverage does not mean all statements or functions were executed. For example, auth middleware shows 100% branch coverage but only 16% statement coverage and 0% function coverage in the supplied c8 output.

3. Limitations

These values are the exact percentages shown in the c8 output supplied for this run. They cover the instrumented backend only; no frontend branch coverage was measured.

4. Follow-up

Expand test execution to cover the currently uncovered statements and functions, then regenerate the branch report. Preserve the c8 text output and lcov artifact as evidence.
