Code Coverage Report

Task Manager Application | Team 4 | Test execution: 6 November 2026

1. Measurement method

Coverage was measured with c8 using an instrumented Node.js backend server while the API integration suite was executed. The reported figures apply to the backend process and source files included in the c8 output; frontend source was not included.

2. Actual coverage results

Scope / file	Statements	Branches	Functions	Lines	Uncovered lines
All files	29.39%	85.71%	0%	29.39%	Not listed
backend (directory)	78.84%	75%	100%	78.84%	Not listed
backend/db.js	100%	100%	100%	100%	—
backend/server.js	70.27%	66.66%	100%	70.27%	17, 21–30
backend/middleware/auth.js	16%	100%	0%	16%	5–25
backend/routes/auth.js	15.44%	100%	100%	15.44%	11–52, 58–119
backend/routes/tasks.js	23.95%	100%	100%	23.95%	13–42, 47–57, 62–93

3. Interpretation

Overall backend coverage: 29.39% statements, 85.71% branches, 0% functions, and 29.39% lines, as printed by c8.

db.js reached 100% in all reported metrics. server.js reached 70.27% statement/line coverage. The middleware and route modules contain substantial uncovered statement ranges, including authentication and task route handling.

4. Follow-up

Add tests that execute the uncovered success and error paths, including token verification, database failures, registration/login edge cases, and all implemented task route branches. Re-run c8 after expanding the suite. Keep frontend coverage as a separate measurement until a frontend coverage runner is configured.
