Updated Test Case Document

Task Manager Application | Team 4 | Test execution: 6 November 2026

1. Test execution summary

Execution date: 6 November 2026. Live backend API integration tests were executed against the configured application and PostgreSQL database. Result: 18 passed, 0 failed.

2. Executed test cases

ID	Test case	Result
API-01	API and PostgreSQL health check	PASS
API-02	Unauthenticated task access rejected	PASS
API-03	Invalid authentication token rejected	PASS
API-04	Invalid registration details rejected	PASS
API-05	New user registration succeeds	PASS
API-06	Duplicate email registration rejected	PASS
API-07	Login with valid credentials succeeds	PASS
API-08	Login with incorrect password rejected	PASS
API-09	Invalid task input rejected	PASS
API-10	Valid task creation succeeds	PASS
API-11	Owner can view created task	PASS
API-12	Owner can update task status	PASS
API-13	Invalid task status rejected	PASS
API-14	Invalid task ID rejected	PASS
API-15	Second user registration succeeds	PASS
API-16	Second user login succeeds	PASS
API-17	Second user cannot view another user's task	PASS
API-18	Second user cannot update another user's task	PASS

3. Additional quality and coverage evidence

Frontend checks: **npm run lint** completed with no ESLint errors; **npm run build** completed successfully (Vite 8.3.4).

Backend: **npm ci** completed; **npm run dev** started the API at http://localhost:5000.

Database health endpoint returned **status=OK** and **database=task_manager**.

Automated live API integration test run: **18 total, 18 passed, 0 failed**. The test script reported cleanup of its two QA users and their tasks.

Coverage was collected with c8 while the backend server was instrumented and the API tests were run against it. These are backend coverage results only.

4. Unimplemented / unverified planned features

Task detail editing, task deletion, and task assignment are not implemented in the inspected local backend routes. The database schema has no assignee_id column. These must remain open gaps against the wider test plan until implemented and tested.

Search/filter and dashboard UI behaviours were not independently exercised by the API integration script. Performance thresholds, usability acceptance, and full security validation were not measured in this run.

5. Execution record note

The corrected API test script saved api-test-results.json in the backend directory. Keep that JSON file with the project evidence if the instructor accepts raw test-run artifacts.
